Logo Mockup

Paper Loop Mockup

3D Print / Paper Housing Mockup

Explanation of Leave-behind piece

I think having an interactive logo could be a really cool leave behind piece. As such, a 3D printed shell with a rotating paper loop could easily accomplish my idea while being able to easily share my information.

My design wouldn't have any elements that would be offensive or unethical, but it will still express my identity as a graphic designer and 3d modeler.

This piece will be advanced, and will take a lot of testing and modeling work to create. One of the issues I can already see is that the paper loop will be too long and will need to be fed into a housing of sorts to accommodate the extra "slides." This could be fixed by reducing the numbers of slides down by 1. Which could easily be done by fitting my portfolio URL into a different slide, maybe the greetings slide or the contact me slide.

This is assuming I have a housing that is at least one "slide" (or inch) thick that allows for 3 slides on the front face, 1 slide on the top face, 3 slides on the back face, and 1 slide on the bottom face - for a total of 8 slides.
